---

What are the sources and % of energy today. (Oil, gas, solar, hydro, electric, Wind, etc), by major consumer: household, transportation, shipping rail, trucking ships air) industries. Show a yearly projection of change in each category and report to the community. I assume there will be a target for 2050, such as 30% solar, 30% hydro, 40% wind which would be used to generate electricity. We still need oil/gas for lubrications, plastics, chemicals.
