The Hon. Jorge O. Elorza  
Mayor

Ricky Caruolo  
General Manager

Mrs. Luly Massaro, Commission Clerk  
RI Public Utilities Commission  
89 Jefferson Boulevard  
Warwick, RI 02888

RE: Dk 4994; New Cost of Service Study

Dear Mrs. Massaro:

Enclosed please find an original and five copies of Providence Water's new Cost of Service Study (COSS) pursuant to Commission's Order No. 23928 issued October 20, 2020. As part of this study, Providence Water also includes a report regarding the hydraulic modeling performed by Pare Corporation engineers supporting Providence Water's new COSS.

Per, Commission's Order No. 23928 item 10, Providence Water estimates the new COSS cost at \$101,078. Providence Water was granted an initial allowance of \$30,000 to be used to develop the new COSS; as such, Providence Water plans to seek an amended rate case expense for the difference.

An electronic copy has been provided to the service list.

Thank you for your attention to this matter.

Sincerely,

*Mary L. Deignan-White*

1 **INTRODUCTION**

2 **Q. Please state your name and business address.**

3 A. My name is Harold J. Smith and my business address is, 5916 DTC Parkway, Suite 850,  
4 Greenwood Village, Colorado.

5  
6 **Q. Are you the same Harold Smith who submitted direct and rebuttal testimony on behalf  
7 of the Providence Water Supply Board (Providence Water) in Docket 4994?**

8 A. Yes, I am.

9  
10 **Q. Please describe the purpose of your testimony.**

11 A. My testimony overviews the development of a new cost of service study (new COSS), reflective  
12 of the Commission's order 23928 (the Order) issued on October 20, 2020. This order requires  
13 Providence Water to "perform a new allocated cost of service study, taking into account the  
14 Commission's directives...".

15  
16 **Q. How does the new COSS relate to the COSS that Providence Water filed as part of the  
17 Amended Settlement Agreement dated August 25, 2020 (the ASA COSS)?**

18 A. The COSS filed on August 25, 2020 was included in an Amended Settlement Agreement (ASA)  
19 entered into by Providence Water, Kent County Water Authority (KCWA), and the City of  
20 Warwick (Warwick). The other intervenors (Bristol County Water Authority and the City of East  
21 Providence) and the Division of Public Utilities and Carriers (the Division) did not sign the ASA.  
22 The ASA amended the initial settlement agreement filed by Providence Water on July 3, 2020 (the  
23 July 3 settlement agreement).

24  
25 The primary difference between the two settlement agreements was the development of individual  
26 wholesale rates under the ASA versus the uniform wholesale rate proposed under the July 3  
27 settlement agreement. These rates were calculated by using individual peaking factors for each  
28 wholesale customer without any other material changes to the approach used in the July 3  
29 settlement agreement. The ASA did not fully implement the result of this new calculation. Instead,  
30 at the Commission's direction, the calculated rates reflected one-third of the change between the

1 rates in the July 3 settlement agreement, and those fully reflective of the individual wholesale  
2 peaking factors. These rates went into effect on August 27, 2020. The new COSS retains the  
3 individual wholesale rate design of the ASA COSS, but also reflects the directives established in  
4 the Order.

5  
6 **Q. What directives did the Commission establish in the Order?**

7 A. The Commission's order identified the following five issues that should be addressed by the  
8 new COSS:

- 9 1. Transmission and Distribution Labor Cost Allocation
- 10 2. Central Operations Facility Allocation
- 11 3. Non-Revenue Water Allocation
- 12 4. Pumping Cost Allocation
- 13 5. Unidirectional Flushing Cost Allocation

14  
15 **Q. Are these the only issues that can be addressed by the new COSS?**

16 A. No. The Order states that the new COSS should, at a minimum, address these specific issues.  
17 However, the Order also indicates the Commission's objective to approve individual wholesale  
18 rates which "have taken into account all relevant factors, in a manner that is fair to all the affected  
19 parties" (p. 33 of the Order).

20  
21 **Q. Does "all relevant factors" mean that the new COSS should be determined without any  
22 regard for the approach used in the ASA COSS?**

23 A. No. The Order is clear that the new COSS is intended to be refinement of the ASA COSS, not  
24 a complete departure from it. The ASA COSS calculated individual wholesale rates by using  
25 individual peaking factors but did not reflect all of the differences in how each wholesale customer  
26 is served by Providence Water. In particular, it did not address the differences in the infrastructure  
27 used to deliver water to each wholesale customer.

1 **Q. Based on your answer to the previous two questions, how does your approach to**  
2 **developing the new COSS relate to the five specific issues identified in the Order?**

3 A. The new COSS has those five issues as its foundation. These were the primary areas of  
4 disagreement among the parties to Docket 4994. In certain circumstances (discussed in greater  
5 detail below), it was appropriate to extend the logic of the approach used to address these issues  
6 to other areas as well.

7

8 **Q. How is the remainder of your testimony organized?**

9 A. The balance of my testimony is focused on how the new COSS addresses each of the five issues  
10 identified in the Order, the resultant rate impacts and suggestions for gradualism in implementation  
11 of the new rates.

12

13 **Q. Have you included any schedules to accompany your testimony?**

14 A. Yes. I have generally included the same schedules as those included in my direct and rebuttal  
15 testimonies, and the two settlement agreements. I have not included those used to develop the  
16 revenue requirement for the rate year. The revenue requirement for the new COSS is based on  
17 Rate Year 2 from the ASA and has not changed. The new COSS focuses on developing an  
18 appropriate allocation of costs, using the Rate Year 2 revenue requirement. Accordingly, the  
19 schedules attached to my testimony include:

- 20 • HJS-1: Cost of Service Summary
- 21 • HJS-13a: Allocation Factors
- 22 • HJS-13b: Pumping and Storage Allocation
- 23 • HJS-13c: Inch-Miles
- 24 • HJS-13d: T&D Labor Allocation
- 25 • HJS-13e: T&D Contract Services Allocation
- 26 • HJS-13f: Net Plant in Service
- 27 • HJS-13g: Central Operations Facility Square Footage Allocation
- 28 • HJS-14a&b: Allocation of RY 2022 Revenue Requirement
- 29 • HJS-15a: Pro-Forma Water Sales
- 30 • HJS-15b: Assignment of Non-Revenue Water (NRW)
- 31 • HJS-16a-c: Customer Class Units of Service
- 32 • HJS-16d: Summary of Customer Class Units of Service
- 33 • HJS-17: Unit Cost of Service
- 34 • HJS-18: Customer Class Cost of Service

- 1 • HJS-19: Development of Volumetric Rates
- 2 • HJS-20a&b: Development of Meter Service Charge and Providence Fire Protection Service
- 3 Charge
- 4 • HJS-21a&b: Development of Private Fireline Charge and Hydrant Charge
- 5 • HJS-22: Proposed Rates
- 6 • HJS-23: Comparison of Revenues by Customer Class
- 7 • HJS-24: Revenue Proof
- 8 • HJS-25: Comparison of Typical Bill Impacts
- 9

10 **TRANSMISSION AND DISTRIBUTION LABOR ALLOCATION**

11 **Q. Mr. Smith please provide a brief overview of the transmission and distribution (T&D)**  
12 **labor allocation issue.**

13 A. Bristol County Water Authority (BCWA) contested the level of T&D labor expenses being  
14 allocated to wholesale customers. BCWA witness Pamela Marchand contended that  
15 no more than 5% of T&D labor expense should be allocated to any of the wholesale customers  
16 because these costs were incurred to maintain smaller mains, which are not used by wholesale  
17 customers. BCWA, Ms. Marchand argued, was only served by mains 30 inches in diameter and  
18 larger and should therefore be allocated only minimal T&D labor expenses.

19

20 **Q. What percentage of T&D labor costs were allocated to wholesale customers (in total) in**  
21 **the ASA COSS?**

22 A. Just under 5%.

23

24 **Q. Could you explain how you arrived at the 5% figure?**

25 A. Certainly. HJS Amended Settlement-14a indicates the allocation of T&D labor. Taking into  
26 account line items 60150 through 60560, these costs were \$6.1 million in the test year. Of this,  
27 \$5.3 million (about 87%) was allocated to retail customers only. Retail only costs include work on  
28 customer service lines, meters and fire hydrants. It also includes work on mains 12 inches and  
29 smaller. The ASA COSS estimated this work by splitting T&D related work orders between  
30 transmission (defined as greater than 12 inches in diameter) and distribution (defined as 12 inches  
31 in diameter and smaller). This split was 40% transmission and 60% distribution based on inch-

1 miles. The detailed allocation of T&D labor based on work orders is shown in HJS Amended  
2 Settlement-13d.

3  
4 Wholesale and retail customers *shared* in the remaining \$783,000 (13%) in proportion to their  
5 demand. Because these mains are used to support base, maximum day, and maximum hour service,  
6 they were split between those three cost components. The details behind this allocation are  
7 described in my direct testimony in this case. The allocation was \$259,000 to base, \$199,000 to  
8 max day and \$326,000 to max hour. Wholesale customers represented 43%, 53% and 23% of the  
9 demand for each category, respectively. Accordingly, the wholesale share of costs can be  
10 calculated as follows:

- 11 • Base costs:  $\$259,000 \times 0.43 = \$111,000$
- 12 • Max Day costs:  $\$199,000 \times 0.53 = \$105,000$
- 13 • Max Hour costs:  $\$326,000 \times 0.23 = \$75,000$
- 14 • Total:  $\$111,000 + \$105,000 + \$75,000 = \$291,000$
- 15 • \$291,000 is just under 5% of the total T&D labor costs of \$6.1 million.

16

17 **Q. What direction did the Commission provide on this issue in the Order?**

18 A. The Commission ordered Providence Water to address this issue in the new COSS “with data  
19 that firmly supports the allocators for future years.”

20

21 **Q. How does the new COSS address this issue?**

22 A. The new COSS allocates T&D labor costs based on the proportion of Providence Water’s pipe  
23 network that each individual wholesale customer uses.

24

25 **Q. What data did you use to support this allocation?**

26 A. I used data developed by Pare Corporation (Pare), an engineering consultant retained by  
27 Providence Water. Pare used Providence Water’s hydraulic model to determine the pipe (by length  
28 and diameter) used by each wholesale customer under normal operating conditions. The details of

1 the hydraulic model analysis are described in a memorandum developed by Pare dated March 4,  
2 2021, attached hereto.

3

4 **Q. What do you mean by “normal operating conditions”?**

5 A. Providence Water’s T&D system is designed to provide service under base, maximum day, and  
6 maximum hour demand conditions. The hydraulic model analysis was conducted under these three  
7 scenarios, which reflects the way that Providence Water typically operates.

8

9 **Q. Mr. Smith, could you describe, in detail, the hydraulic modeling data and how it was used  
10 in the allocation of T&D labor costs?**

11 A. Yes. The output from the hydraulic modeling analysis is the number of inch-miles (length of  
12 pipe multiplied by diameter) used by each wholesale customer. The inch-miles for retail are  
13 determined by subtracting the wholesale inch-miles from the total for the system. The breakdown,  
14 by customer, is shown on HJS-13c.

15

16 HJS-14a indicates the allocation of T&D labor costs, which total \$6.3 million in rate year 2. Similar  
17 to the ASA COSS, the new COSS attributes a certain portion directly to retail customers only. This  
18 included work on customer service lines, meters, and fire hydrants. In the new COSS, however all  
19 T&D labor (i.e., excluding service lines, meters, and fire hydrants) is shared between retail and  
20 wholesale customers, without a direct allocation to retail only. The new COSS does not use a  
21 defined diameter cut-off (i.e., 12 inches) like the ASA COSS. Instead, it uses the hydraulic model  
22 results to evaluate each customer’s use of all the mains without presuming that a certain size is too  
23 small to be used to provide wholesale service. Put differently, the new COSS lets the data inform  
24 the decision as to which mains should be shared, rather than using a rigid cut-off.

25

26 Accordingly, the retail only component in the new COSS is \$4.3 million (68%). The retail only  
27 portion is smaller because, as noted above, it does not presume that a certain size main is, by  
28 definition, used to serve retail customers only. The balance of T&D labor costs, \$2 million (32%),  
29 is shared by retail and wholesale customers based on inch-miles.

30

1 The allocation to each customer is based on their share of inch-miles relative to the total. This  
2 allocation involves determining a unit cost per inch-mile (see HJS-17) and multiplying by each  
3 customer's inch-miles (see HJS-18).

4  
5 **Q. What are the key differences in the approach used for allocating T&D labor under the**  
6 **ASA COSS and the new COSS?**

7 A. There are two differences. The first difference is that new COSS does not presume that a certain  
8 size main should be, by definition, considered a "retail only" main. Instead, data from the hydraulic  
9 model analysis is used to determine which mains are actually used, regardless of size. The ASA  
10 COSS, by contrast, automatically defined 60% of Providence Water's T&D system as "retail only"  
11 based on the 12 inch cut-off. This change, on its own, would tend to *increase* T&D labor costs  
12 included in the wholesale rates.

13  
14 The second change is that inch-miles, rather than demand, are used to allocate T&D labor. As  
15 noted above, wholesale represents approximately 43%, 53% and 23% of base, max day and max  
16 hour demand, respectively. That said, they only use about 13% of the inch-miles. Switching from  
17 demand to inch-miles, on its own, would tend to *decrease* T&D labor costs included in the  
18 wholesale rates.

19  
20 The combined impact of the two changes is to slightly *decrease* the allocation of T&D labor costs  
21 to wholesale customers (as a group). Wholesale customers are being allocated a smaller proportion  
22 of Providence Water's full pipe network under the new COSS, versus a larger allocation of a  
23 narrowly defined (i.e., only larger than 12 inches) pipe network under the ASA COSS. Under the  
24 ASA COSS, this allocation was just under 5%. Under the new COSS, this allocation is around 4%.

25  
26 **Q. Mr. Smith, could you overview how you modified your schedules to reflect this change?**

27 A. The ASA COSS had two primary groupings of cost components (see my direct testimony in  
28 this case for a more detailed explanation): common to all and retail only. Common to all costs  
29 were those incurred to serve all customers (retail and wholesale). These costs were allocated to  
30 each customer class (i.e., the 3 retail classes and each individual wholesale customer) based on

1 demand (base, max day, and max hour). Retail only costs were those incurred to serve retail  
2 customers only. These costs were allocated among the 3 retail classes and fire protection but were  
3 not allocated to wholesale customers. The new COSS adds additional columns to each schedule to  
4 reflect the inch-miles approach to allocating T&D labor costs. These columns are labeled  
5 “Common to All – T&D.” Costs that are common to all customers that are not related to T&D are  
6 now allocated to the columns labeled “Common to All – Supply, Treatment and Low Service”. I  
7 will provide additional explanation of this category later in my testimony.

8  
9 **Q. Mr. Smith, how did you approach the allocation of the remaining (non-labor) T&D**  
10 **operating expenses and the net plant in service for T&D?**

11 A. I extended this same approach to the allocation of the remaining T&D operating expenses and  
12 the T&D net plant in service allocator. Namely, the other non-labor operating costs were allocated  
13 based on inch-miles. I also adjusted the T&D net plant in service allocator (see HJS-13f) so that  
14 T&D net plant in service is now allocated to the new “Common to All – T&D” component. This  
15 allocation does not directly impact the allocation of T&D capital costs but is used in the  
16 development of capital cost allocators, which are used to allocate the funding for Providence  
17 Water’s restricted funds.

18  
19 **Q. Mr. Smith, does this result in a more equitable allocation of T&D costs among Providence**  
20 **Water’s customer classes?**

21 A. Yes. While the difference between wholesale and retail is not substantial, the hydraulic model  
22 analysis demonstrates that the use of Providence Water’s T&D system is not purely proportionate  
23 to demand, as the ASA COSS presumed. Kent County, for example, is Providence Water’s second  
24 largest customer, but requires the least of amount of T&D infrastructure. Smithfield is the opposite,  
25 requiring the most infrastructure relative to the amount of water delivered. This approach improves  
26 the alignment between the way each customer uses the system and the way in which costs are  
27 allocated among the wholesale customers.

1 **CENTRAL OPERATIONS FACILITY ALLOCATION**

2 **Q. Mr. Smith please provide a brief overview of the Central Operations Facility (COF) issue.**

3 A. First, it is important to recognize that the allocation of the COF is an allocation of the net plant  
4 in service for the COF (i.e., the depreciated value of the facility per Providence Water's accounting  
5 records). The allocated net plant in service is then used in the development of the capital allocators,  
6 which are in turn used to allocate Providence Water's capital costs.

7  
8 The issue, as it relates to the Order, pertains to the COF allocator on HJS Amended Settlement-  
9 13g. In my direct testimony I developed this allocator by allocating the square footage of each area  
10 of the building, in accordance with its purpose. Those which could not be directly assigned were  
11 allocated in proportion to all directly assignable space. The point of disagreement centered on the  
12 Commercial Services area, which is used for Providence Water's customer service, billing and  
13 collection activities. In my direct testimony, I allocated the square footage for this area to the retail  
14 only cost components category, attributing none of the square footage to Providence Water's  
15 wholesale customers. The Division's expert, Mr. Mierzwa, objected to this allocation and proposed  
16 adjusting the allocator such that 10% of commercial services square footage was assigned to  
17 wholesale customers. BCWA objected to this assignment based on the fact that wholesale  
18 customers represent a small fraction of the total number of Providence Water customers (i.e., 7 out  
19 of about 78,000). The 10% allocation was ultimately incorporated into the ASA COSS.

20  
21 **Q. What direction did the Commission provide on this issue in the Order?**

22 A. The Commission ordered Providence Water to address this issue in the new COSS "with data  
23 that firmly supports the allocators for future years."

24  
25 **Q. How does the new COSS address this issue?**

26 A. The new COSS adjusts the allocation such that 6.67% of commercial services square footage  
27 is attributed to wholesale customers.

1 **Q. What data did you use to support this allocation?**

2 A. This allocation is based on the number of billing cycles for retail and wholesale customers.  
3 While Providence Water's wholesale customers only represent a small proportion of the total,  
4 greater effort is required to test and read their meters, generate bills, and process payment. In fact,  
5 Providence Water has 1 billing cycle dedicated to its 7 wholesale customers and 14 for the  
6 remaining 78,000. Accordingly, the new COSS adjusts the allocator for Commercial Services  
7 square footage, such that only 6.7% (1 out of 15 billing cycles) of Commercial Services square  
8 footage is attributed to wholesale customers.

9

10 **Q. Does this approach result in an equitable attribution of commercial services square**  
11 **footage to wholesale customers?**

12 A. It does. The approach of taking the ratio of the 7 wholesale customers relative to the total is  
13 predicated on the presumption that each wholesale customer is the same as any typical retail  
14 customer, which is not the case. While they are only 7 customers, they are more than 20% of  
15 Providence Water's revenues and require more manual meter reading, billing and collection  
16 processes. This is evidenced by the fact that they have their own billing cycle, while the remaining  
17 cycles are used to bill the other 78,000 customers.

18

19 **NON-REVENUE WATER (NRW) ALLOCATION**

20 **Q. Mr. Smith please provide a brief overview of the non-revenue water (NRW) issue.**

21 A. The issue with respect to NRW related to the allocation of "Water Quality and Testing" volumes  
22 from Providence Water's Lost and Unaccounted for Water Report. These volumes included  
23 102,823 hundred cubic feet (HCF) of water related to the draining of the Ridge Road tank so that  
24 it could be repaired. This tank is used to serve the retail distribution system in that area. Under the  
25 ASA COSS these volumes were allocated, in part, to wholesale customers resulting in an overall  
26 allocation of Water Quality and Testing volumes to wholesale of 47.4%.

27

28

29

30

1 **Q. What direction did the Commission provide on this issue in the Order?**

2 A. The Commission accepted the 47.4% allocation in the ASA COSS but ordered “Providence  
3 Water to address this issue in its new allocated COSS with data that firmly support the allocators  
4 for rate years two and three.”

5  
6 **Q. How does the new COSS address this issue?**

7 A. The new COSS addresses this issue by allocating the volume associated with draining the Ridge  
8 Road tank to retail customers only. Further, it uses the data from the hydraulic model analysis to  
9 refine the allocation of main flushing and real losses. The allocation of NRW is indicated on HJS-  
10 15b.

11  
12 **Q. What data did you use to support these allocations?**

13 A. I used output from the hydraulic model analysis to refine these allocations. Main flushing and  
14 real losses under the ASA COSS were allocated using an approach similar to the allocation of  
15 T&D costs (i.e., shared transmission mains were defined as 16” and above, then allocated based  
16 on demand). The hydraulic modeling analysis allows for a refinement of this approach such that  
17 each customer can be allocated their share of losses based on the proportion of Providence Water’s  
18 system that is used to deliver water to them. Main flushing volumes, in the new COSS, are now  
19 allocated based on length of pipe 12 inches and smaller, which represents the largest diameter pipe  
20 that is flushed by Providence Water. Real Losses, which represent the physical losses in the system  
21 (leakage) are now allocated based on pipe length, plus an allowance for retail service lines of 225  
22 miles.

23  
24 **Q. What is the impact of the allocation of Water Quality and Testing volumes to wholesale  
25 customers?**

26 A. Under the new COSS, with the Ridge Road tank volumes reallocated to retail only, the  
27 wholesale share of these volumes has been *reduced* from 47.4% to 43.2%.

28  
29

1 **Q. What proportion of total NRW is being assigned to wholesale customers in the new**  
2 **COSS?**

3 A. Under the new COSS total NRW allocated to wholesale customers has been reduced from  
4 16.2% to 14.1%.

5

6 **PUMPING COSTS ALLOCATION**

7 **Q. Mr. Smith please provide a brief overview of the pumping costs allocation issue.**

8 A. Most of Providence Water's system is fed by gravity and does not require any additional  
9 pumping. All customers use the gravity portion of the system. There are some customers, however,  
10 which are served by the gravity system and a series of pump stations. Customers that only use the  
11 gravity portion of the system are referred to as low service customers. Customers that use the  
12 gravity system and require pumping are referred to as high service customers. Bristol County, East  
13 Providence, Kent County and Warwick are low service customers and do not require additional  
14 pumping. Greenville, Lincoln and Smithfield are high service customers and are served by two  
15 pump stations: the Neutaconkanut Pump Station and the Bath Street Pump Station. The allocations  
16 in my direct testimony in this case did not make a distinction between these two groups because  
17 Providence Water was not proposing individual wholesale rates. In my direct testimony, there was  
18 one class (wholesale) making this distinction unnecessary. The ASA COSS did include individual  
19 wholesale rates, but—like Providence Water's initial filing—did not distinguish between high and  
20 low service customers. The only differentiator in the ASA COSS was individual wholesale  
21 customer peaking factors.

22

23 **Q. What direction did the Commission provide on this issue in the Order?**

24 A. The Commission ordered Providence Water to address this issue in its new COSS by allocating  
25 pumping costs “based upon the benefits received by each wholesale customer.”

26

27 **Q. How does the new COSS address this issue?**

28 A. The new COSS addresses this issue by differentiating between the low service system, which  
29 is used by all customers, and the high service system, which is used by retail customers, Greenville,  
30 Lincoln and Smithfield only.

1 **Q. Mr. Smith, could you describe how you modified your schedules to reflect this change?**

2 A. I added two groups of cost components titled “CTA – Supply, Treatment & Low Service” and  
3 “High Service and Retail” to each relevant schedule. CTA – Supply Treatment and Low Service  
4 costs are those which relate to Providence Water’s source of supply, treatment plant and the  
5 Aqueduct and Neutaconkanut Reservoirs. These costs are incurred to serve all customers and are  
6 allocated based on base, maximum day, and maximum hour demand for each customer class on  
7 Schedule HJS-16d. High Service and Retail costs relate to Providence Water pump stations which  
8 are used to serve certain wholesale customers and Providence Water’s retail customers. These  
9 costs are allocated based on base, maximum day and maximum hour demand for retail, Greenville,  
10 Lincoln and Smithfield.

11  
12 Schedule HJS-13b indicates the development of Factors 18 and 19, which are used to allocate  
13 pumping costs. Factor 18 is based on pump station capacity and is used to allocate pump station  
14 net plant in service on Schedule HJS-13f. Factor 19 is based on pump station power costs and is  
15 used to allocate pumping expenses on HJS-14a.

16  
17 Schedule HJS-19 provides an overview of how these components are incorporated into the ultimate  
18 volumetric rates for each class.

19  
20 **Q. Mr. Smith, did you also evaluate Providence Water’s storage assets to ensure they were  
21 appropriately allocated for the purpose of developing individual wholesale rates?**

22 A. Yes. Providence Water has a number of treated water storage reservoirs and elevated storage  
23 tanks which work in concert with the pump stations to meet the demands of Providence Water  
24 customers (retail and wholesale). Based on discussions with Providence Water staff, I created  
25 Factor 20, which is used to allocate Providence Water’s storage costs. It is based on the use and  
26 capacity of each reservoir and tank. The Aqueduct and Neutaconkanut reservoirs are used to serve  
27 all customers. The Longview reservoir is used by high service customers only. The Lawton hill  
28 reservoir and the two elevated storage tanks are used by retail customers only.

1 **Q. Mr. Smith, does this result in a more equitable allocation of pumping and storage costs**  
2 **among Providence Water’s customer classes?**

3 A. Yes. Following these changes, the new COSS recognizes the difference in how Providence  
4 Water’s pump stations, reservoirs and tanks are used to serve each customer class. This was not  
5 relevant under the ASA COSS because wholesale, as a group, used all of these assets. Under an  
6 individual wholesale rate determination, however, it is appropriate to differentiate the use of these  
7 assets, by wholesale customer.

8  
9 **RATE IMPACTS AND SUGGESTIONS FOR GRADUALISM**

10 **Q. Mr. Smith, please overview the impacts of the new COSS Providence Water’s customer**  
11 **classes.**

12 A. The impact of these changes is shown on HJS-23. Based on the revenue requirement from the  
13 ASA, Providence Water requires an overall revenue increase of 5.2% in FY 2022. Under the new  
14 COSS, retail customers (in total) would see an 7.8% increase from the rates that are currently in  
15 effect. Wholesale customers (in total) would see a 4.4% decrease from the rates that are currently  
16 in effect. The impact among wholesale customers varies substantially, however. East Providence,  
17 Kent County and Warwick would see rate decreases. Bristol County, Greenville, Lincoln and  
18 Smithfield would see rate increases. While Bristol County’s increase is just below the overall  
19 revenue increase, the increases for Greenville, Lincoln and Smithfield are all more than double the  
20 overall revenue increase.

21  
22 **Q. Mr. Smith, given these impacts, would it be appropriate for the Commission to consider**  
23 **a more gradual phase-in of these changes?**

24 A. Yes, and there are a few different approaches that could be considered. The Commission could  
25 employ the same approach used in the ASA COSS. Namely, moving 1/3<sup>rd</sup> of the way to cost of  
26 service rates in FY 2022 and another 1/3<sup>rd</sup> in FY 2023. Another approach would be to establish a  
27 percentage increase cap of 1.75 times<sup>1</sup> the overall revenue requirement increase. Classes above the  
28 cap would be limited to an increase of that amount, with the difference recovered via higher

---

<sup>1</sup> The 1.75x cap was a Division recommendation for Providence Water’s fire and service charges, which was ultimately incorporated into the ASA.

1 increases to customers below the cap. In either case, further cost of service based adjustments  
2 could then be evaluated in Providence Water's next full rate filing.

3

4 **Q. Mr. Smith, does this conclude your testimony?**

5 A. Yes it does.

6

## MEMORANDUM

DATE: March 4, 2021

TO: Gregg Giasson, P.E. – Executive Engineer  
Peter LePage – Director of Engineering

CC: Christen Constantino, Pare Corporation  
Matthew Sprague, Pare Corporation

FROM: Timothy P. Thies, P.E. – Pare Corporation

RE: Transmission and Distribution Piping Evaluation  
Wholesale Cost of Service Study  
Providence Water Supply Board  
**Pare Project No. 14256.17**

The purpose of this memorandum is to provide a summary of the hydraulic modeling performed by Pare Corporation (Pare) in support of Providence Water's recent wholesale cost of service study. Using Providence Water's computerized hydraulic model, Pare performed a study of the transmission and distribution piping that supplies water to each of Providence Water's wholesale customers. Specifically, those customers include:

1. Bristol County Water Authority
2. Kent County Water Authority
3. City of East Providence
4. Lincoln Water Commission
5. Greenville Water District
6. Smithfield Water Supply Board
7. City of Warwick

The purpose of the study was to identify which transmission and distribution pipes supply water to each wholesaler customer during three demand scenarios – average day demand (ADD), maximum day demand (MDD), and peak hour (or max hour) demand (PH). The model was used to trace the flow path from the Providence Water's treatment plant to each wholesale customer. Once the flow path was identified for each demand scenario, the model was used to identify how much water (in terms of flow rate) moves through each pipe segment, and how much of that flow rate can be attributed to each wholesale customer. From that data, Pare was able to tabulate how many miles of pipe each wholesale customer utilizes and what the breakdown of pipes is by diameter. Pare was also able to provide a summary of the percentage of flow in each pipe that can be attributed to any one wholesale customer.

A description of Pare's methodology is provided below, and a summary of the results are provided in the attached tables.

### Draw Rate Analysis

The first step in the modeling process was to identify how much water (in terms of flow rate) each wholesale customer draws through Providence Water's system under ADD, MDD, and PH scenarios. An important element of this study is recognizing that the flow rate that each wholesale customer draws through Providence Water's system is not necessarily equal to their consumption on an average day, maximum day, or during a peak hour demand.

To illustrate how the draw rate for each wholesaler can vary from actual consumption, consider Lincoln Water Commission's (LWC) demand. LWC draws water from Providence Water through a pump station that has two pumps. LWC's consumption varies day to day and hour by hour, but when they draw water from Providence Water they do so at a relatively fixed rate. There are three draw scenarios for LWC – one when they are drawing no water from Providence Water, one when they are drawing water with one pump on, and one when they are drawing water with two pumps on. During relatively low consumption periods they will draw water using one pump. During relatively high consumption periods, LWC will draw water using two pumps. There are also times when LWC is consuming water but drawing water solely from their own storage tanks and not from Providence Water. The result is a draw rate that does not necessarily match system consumption.

The draw rate for each wholesale customer was established in the model using recent SCADA data from days when Providence Water's system demand closely matched their ADD, MDD, and PH demands. Pare examined SCADA records for selected days to evaluate how each wholesale customer draws water from the Providence Water system. Pare then set each wholesaler's draw rate in the model to a value that represents their draw rate during each demand scenario. Every wholesale customer draws water from Providence Water in their own unique way. Some, like LWC, draw their water through pumps. Others draw water through gravity connections without the use of pump but control the flow of water with control valves. Through our evaluation of SCADA data, Pare matched each wholesale customer with their unique draw rate and used that draw rate to evaluate their utilization of Providence Water's transmission and distribution piping during each demand scenario.

### Back-Tracing

Starting at the point of interconnection, Pare traced the flow path of each wholesale connection back to the treatment plant. As the flow path was traced, each pipe segment in the model was flagged for the individual wholesale customer. The flagging was used to sort and extract data from the model relative to each wholesaler customer's flow path. As the flow path was mapped through the transmission and distribution piping, the path was simultaneously logged into a database created in Microsoft Excel. The type of data tracked in the database included total flow in each pipe section, portion of flow that can be attributed to each wholesale customer, pipe segment length, and pipe segment diameter.

The process of tracing the flow path from the wholesale connection to the treatment plant, called “back-tracing” starts at the connection point of each wholesaler. At that point in the system, 100% of the total flow in the pipe segment belongs to the wholesale customer. As flow is traced backwards away from the wholesale connection toward the treatment plant, the total flow in the pipe network increases as the network picks up flow from retail demand and other wholesale customers. However, the amount of flow that belongs to an individual wholesaler remains unchanged. For example, one wholesale customer may have a draw rate of 1,000 gpm. At the connection to their system, the total flow in the upstream pipe segment would be 1,000 gpm, meaning 100% of the flow in that pipe belongs to that wholesale customer.

**FIGURE 1**

As the flow is traced back to the treatment plant, the total flow in the pipe network might increase to say 50,000 gpm, of which only 1,000 gpm belongs to the wholesaler customer, or 2% of the flow in that pipe.

For most wholesale customers, as flow is traced backwards away from their connection, the pipe network splits. At each split, a certain percentage of the flow goes in one direction and a certain percentage goes in another direction. As the flow splits, the proportion that belongs to a wholesale customer splits proportionately. For example, if a pipe has a total flow rate of 100 gpm and splits into two pipes of 70 gpm and 30 gpm, the wholesale customers demand would split 70% and 30% accordingly. If the wholesale customer’s draw rate is 50 gpm, one path would account for 70% or 35 gpm and the other would account for 30% or 15 gpm.

**FIGURE 2**

The process of back-tracing is an iterative process where the engineer works backwards through the system, starting at the wholesale customer and moving toward the source, in this case the treatment plant. The engineer tracks and logs the total flow and wholesale customer flow in each pipe segment. The engineer calculates the split at each node where the pipe network splits, follows one leg of the split to the source (or to the next split in the pipes). After one leg is traced all the way back to the treatment plant, the tracer goes back to the original pipe split and works through the other pipe leg in the same manner until each pipe split has been traced back to the treatment plant. As mentioned previously, as the flow splits at junctions, the total flow that belongs to any one wholesale customer similarly splits, which leads to smaller and smaller flow rates being traced back through the system. In some cases, the flow might split many times before it gets back to the treatment plant. In some instances, the flow might split so many times that the amount of a wholesale customer's flow in a particular pipe section might be a relatively small percentage of their total draw rate. In cases where a wholesale customer's flow in a specific pipe section was less than 1% of that wholesale customer's total draw rate, Pare did not trace that flow back to the treatment plant. Tracing relatively low (i.e., less than 1% of draw rate) generally results a disproportionately large amount of back-tracing but very small amounts of transmission and distribution piping being added to the overall inventory of pipes.

### Inch-Mile Analysis

Every wholesale customer uses a different combination of pipes to move water from the treatment plant to their connection. Some wholesale customers might rely solely on large pipes over 30 inches in diameter, while others might rely on smaller diameter pipes as small as 8 inches in diameter. To compare each system to every other system in terms of how much piping they utilize, Pare calculated the total amount of inch-miles that each wholesale customer utilizes. To calculate the inch-mile summary, Pare multiplied each pipe segment's length (in miles) by its diameter (in inches) and then added the results of all the pipe segments for that wholesale customer. The result is a summation of all the transmission and distribution pipes that each wholesale customer's flow touches on its way to the wholesale connection point. Understanding that the amount of flow in each pipe segment attributed to any one wholesale customer varies, anywhere from <1% to 100

percent, the inch-mile value for each pipe segment was pro-rated by the percentage of flow that can be attributed to each wholesale customer. The resulting summation is a reasonable representation of the total pipe infrastructure that each wholesale customer utilizes when it draws water through Providence Water's system.

To assist Providence Water's rate consultant, results from the piping evaluation are provided in the attached table that breaks down each wholesale customer by pipe diameter, inch-miles, and total miles of pipe utilized by each wholesale customer during an ADD, MDD, and PH scenario.

Attachments: Summary Tables 1-4 for Inch-Mile Analysis
